

**Our goals is to design and supply durable first class solutions suitable for our customers need**

**During long experience in composting we have developed an effective system to de-odorize the exhaust gases.**

**Now these tested first class systems are available also for all our non composting base customers. Tested gascleaning systems can be bought as separate independent systems for our customer`s benefit. The treated airflow may vary from 100 m<sup>3</sup>/hour to 100 000 m<sup>3</sup>/hour**

We can offer three different technical solutions for odour reductions:

- Ozone treatment = Our Odoratus-system
- Wide range of biofilters
- Wetscrubbers

**Wetscrubber- How does it works ?**

- Process gases are blown into the filled column
- Gasflow is washed with water or mixture of water and small amount of acid or base
- Odour compounds are dissolved in water
- Clean and odourless air is led to outside
- Condensed water from process gases is drained
